Private GP Service & Consultant Services | GP Appointment on the same day or next day

# MediWell Man Scans

For many men the term ultrasound is more closely linked with pregnancy than their own well-being. However, this form of technology has proved extremely useful in detecting a wide range of ailments with the human body as a whole. As a result, ultrasound is now widely used as a tool to diagnose a wide range of illnesses in men.

## Testicular Scan

A testicular scan can be used to assess a testicular lump or swelling as well as to assess the structures within the scrotum such as the epididymis (tube connected to testis).

Details would be discussed with our Consultant during the appointment and a copy of the medical report will be provided.

## Kidney and Bladder Scan

The kidneys are responsible for a wide range of high priority functions within your body such as removing toxins, balancing fluids and producing urine. Using non-invasive ultrasound scanning we can assess the following features of the kidneys:

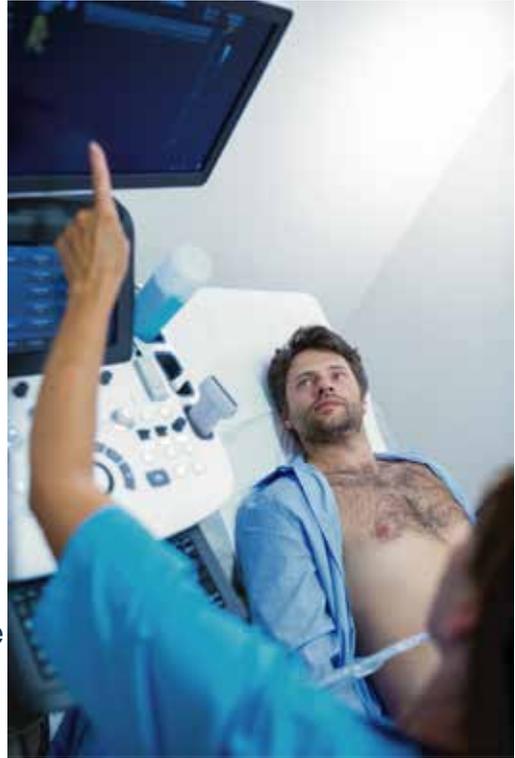

- Size
- Shape
- Outline
- Echogenicity (the ability to return the ultrasound echo)

This scan is usually done with a full bladder, so please drink 2 pints of water 30 minutes before the scan.

# Prostate Scan

After an assessment of your bladder and kidneys, we will ask you to empty your bladder to look for the amount of residual urine post micturition. Certain conditions of the prostate prevent the urinary bladder from emptying properly and can lead to recurrent infections within retained urine. A prostate scan will be done trans-abdominally, with a full bladder to assess the size of the prostate.

Once completed, we will provide you with a full report and images which you can take to your GP for further consultations if necessary.

# Liver and Upper Abdominal Scans

At the MediWell Clinic London, we will assess the size, shape and echo of the liver as well as look for any changes such as cysts, masses, fatty infiltration or alcohol related liver disease. We will scan your pancreas, spleen and gallbladder, searching for any changes and calculi as well as free fluid within the abdomen. We would advise that no food is consumed at least 4 hours before the abdominal scans.

# MediWell Woman Scans

Our Clinic offers a range of well-woman scans that include;

- Pelvic scan
- Ovarian cancer screening scan
- Fertility scan
- Liver and upper abdominal scan
- Kidneys and bladder scan

## Private Fertility Ultrasound Scans

During this scan we will be checking;

- The endometrium (lining of the womb) for polyps and fibroids
- The ovaries
- Surrounding pelvic structures
- Searching for cysts, masses or simply normal follicles

Follicle tracking is available for women who wish to conceive as well as women who are undergoing IVF treatment here or abroad. Your detailed medical report will be given to you on the same day, immediately after your appointment.

# Ovarian Cancer Tests

Ovarian cancer shows a higher incidence in women of postmenopausal age. At the MediWell Clinic London we offer a postmenopausal ovarian cancer screening program. During the screening we will be looking for:

- Cysts
- Masses
- Polyps

Should you wish to see a gynaecologist or add blood tests for cancer markers, we can help you organise this. All findings will be discussed with you on the day, with your medical report provided after the appointment. The scan is best performed with an empty bladder trans-vaginally. Please let us know if you might be allergic to Latex.

## Kidney Scan

Using non-invasive ultrasound scanning, we can assess the following features of the kidneys:

- Size
- Shape
- Outline
- Echogenicity (the ability to return the ultrasound echo)

These scans will help us determine and assess for any possible cysts, kidney, masses, calculi or dilatation of the kidneys' collecting system.

## Bladder Scan

Urinary bladder tests should be done with a full bladder (please drink two pints of water 30min before the scan). When performing this scan we will look at the bladder to find indications of:

- Bladder Masses
- Calculi (Stones) within the bladder

## Pelvic (Transvaginal) Scan

Performed trans-abdominally with a full bladder or trans-vaginally with an empty bladder, pelvic scans are used to assess the uterus and ovaries for a wide range of pathologies including:

- Ovarian Cysts/Masses
- Uterine
- Fibroids
- Polyps

In addition, an ovarian cancer screening scan can be performed for pre or postmenopausal women. Please let us know ahead of the scan if you are allergic to Latex.

# MediWell Pregnancy Scans

Our Clinic offers a range of services for various stages of pregnancy.

## Early Pregnancy Scan

The starting point for your pregnancy journey will most likely be the Early pregnancy scan, usually performed between 6-12 weeks. The Early pregnancy scan includes;

- Measurement of an embryo
- Viability and dating with an estimated due date

We will be looking at the correct intrauterine position of the pregnancy, viability to see and hear the foetal heartbeat and to establish how many weeks into your pregnancy you are. The scan is usually performed trans-abdominally, where the ultrasound probe would gently glide over your abdomen. However, if your pregnancy is at a very early stage and not as well visible trans-abdominally, we might need to opt for a transvaginal scan, with your agreement, which is entirely painless and harmless.

During your consultation we will present you with a written report and images at the end of a scan to take home. In addition, we will discuss all findings with you which you can then discuss further with your GP, Consultant or Midwife.

## Dating Scan

Private pregnancy dating scans measure your baby to establish the duration of your pregnancy and estimate due date. During this scan we will be looking at the position of your baby, baby's heartbeat and maternal structures to exclude cysts or fibroids. In addition, you will be able to see and hear the baby's heartbeat and we will give you a written report, measurements and images at the end of your scan. We are happy to provide complimentary 3D images for you at this stage.

# Gender Baby Scan

A gender baby scan should be ideally performed after 16 weeks of pregnancy when the accuracy of predicting the baby's gender is higher. MediWell Clinic London will provide you with a written report including measurements and a wellbeing check of your baby, as well as scan images of your baby.

Should you wish to find out the gender of your child earlier, the results can be less accurate and we require a minimum of 14 weeks of pregnancy.

# Anatomy Scan

Anatomy scan - also known as Anomaly Scan - is performed from 18-24 weeks and is used to look for possible anomalies within the foetus. During this scan we will be looking at the baby's:

- Brain Head Face
- Heart Abdomen Kidneys Bladder
- Spine Bones Hands Feet

In addition, we will also look at the placenta, fluid and foetal position.

Following your scan, we will provide you with a measurement report and detailed anatomy survey, along with complimentary images in 2D or 3D. If you wish we can tell you the gender of your baby.

# Growth Baby Scan

Growth baby scans are usually performed from 28 weeks until the end of the pregnancy. During this test we will be measuring your baby and checking;

- Wellbeing
- Movements
- Fluid around the baby
- Foetal and placental position

Making sure there are no foetal anomalies seen at this stage.

This scan is the ideal opportunity to see your baby in 3D at no extra cost. As always, at the end of the scan you will get a measurement and receive medical report with images and measurements. EFW (estimated foetal weight) and Doppler Scan will be performed if and when needed.

# 4D Baby Growth Scan with Doppler

This is the same Growth Scan with an added full 4D moving images view, all captured on a DVD for you to take home and treasure.

A Doppler ultrasound scan is also performed, as an additional scan service, measuring your baby's blood flow in various organs and ensuring your baby is well and receiving all the necessary nutrients via the placenta.

# 4D Baby Scan Premium Package

Our Premium 4D baby scan package gives you a wonderful bonding experience and insight into your baby's world.

- Growth report
- Black and White 3D images
- Four 3D glossy images
- DVD with moving 3D images
- CD with still images
